

OPTION 1: without backup

1. Create a db
2. Name in .env is same as name in postgresSQL db
3. Start backend :
4. Open query tool run database.sql and do two minor changes first remove add column and instead of semicolon add comma
5. Run the query
6. Now create backend/seedAdmin.js
7. Paste

```
const pool = require("../src/config/db");
```

```
const bcrypt = require("bcryptjs");
```

```
async function seedAdmin() {
```

```
  const hash = await bcrypt.hash("admin123", 10);
```

```
  await pool.query(
```

```
    `INSERT INTO users(name,email,password,role)
```

```
    VALUES($1,$2,$3,$4)` ,
```

```
    [
```

```
      "Admin",
```

```
      "admin@gmail.com",
```

```
      hash,
```

```
      "admin",
```

```
    ]
```

```
  );
```

```
  console.log("Admin Created Successfully");
```

```
  process.exit();
```

```
}
```

```
seedAdmin();
```

8. Run : cd backend

node seedAdmin.js

9. For checking run : `SELECT * FROM users;`

10. Now start the backend and frontend

OPTION 2: backup file
